colophon.

CODENEXUS INDIA 2026 / ROUND 2

Every claim leaves a trail.

The record behind every publish.

Evidence-first brand governance. Inspect the draft, follow its sources, and preserve the final human decision.

NORTHLINE / FICTIONAL DEMO DRAFT

Our AI autopilot guarantees 40% faster results for 20,000 customers.

TERM-006 CLAIM-004 FACT-021

Real checks. Human approval. An inspectable record.

WORKING LOCAL DEMO / PUBLIC DEPLOYMENT PENDING

01 / THE WORKING PRODUCT

A review with a source.
A decision with a history.

Brand guidance is scattered. Colophon turns it into an inspectable review: the exact phrase, the governing evidence, a focused correction, and an accountable human decision.

01 **Establish the source of truth.**

Manage approved facts, terminology, claims policies, and tone guidance.

02 **Put the words under the lens.**

Run subject-aware deterministic checks. Inspect precise findings and source snapshots.

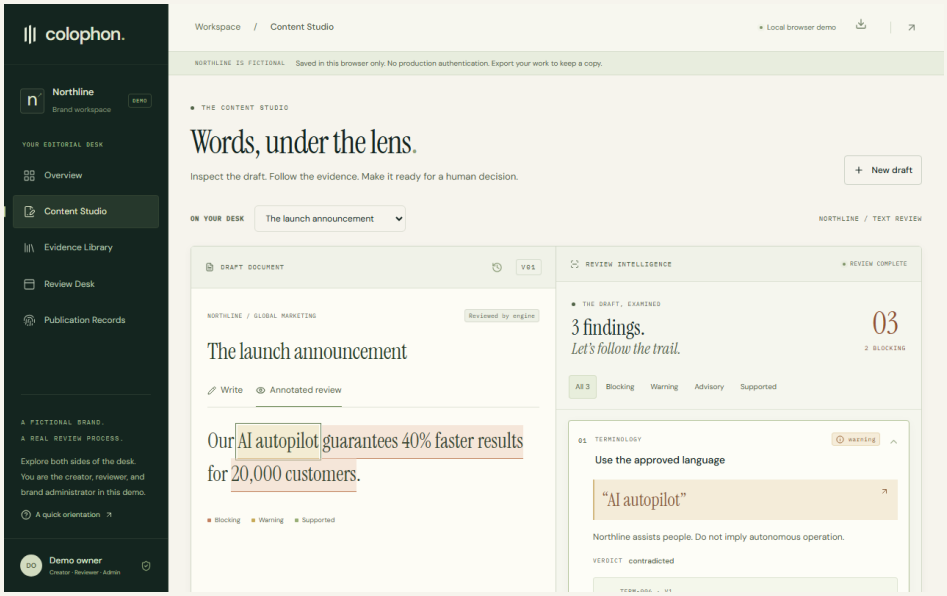

03 **Revise, rescan, and decide.**

Preserve revisions. Request changes or record explicit, reasoned human approval.

04 **Keep the Publication Record.**

Retain exact words, policy versions, exceptions, the reviewer, and the audit trail.

ACTUAL APPLICATION CAPTURE / CONTENT STUDIO

02 / ENGINEERING & EVIDENCE

Built around the workflow. *Honest about its boundaries.*

One coherent application.

Next.js App Router, React, TypeScript, Zod, Lucide, and custom CSS. A pure command handler and verification engine power both browser-local and optional hosted modes.

Four explicit verdicts.

Supported, contradicted, insufficient evidence, and advisory. Case-insensitive terminology, subject-specific numerical facts, guarantee policies, and tone guidance produce exact source spans. Missing evidence is never equated with falsehood.

A version is never silently rewritten.

Saved revisions are immutable. Suggestions use validated text offsets. New evidence revisions and expiry invalidate stale scans. Approval copies the exact reviewed revision, source versions, findings, exceptions, and relevant audit events.

Immediately usable without credentials.

An isolated browser-local Northline demo provides real verification, revision, approval, and publication records. Browser storage is not production authentication or a tamper-resistant database. All Northline sources and statistics are fictional.

Optional server infrastructure.

Supabase anonymous auth, server membership checks, RLS, revision compare-and-swap, append-only history guards, and database rate limiting are implemented. Live database acceptance remains pending project credentials.

Optional AI, carefully constrained.

The hosted OpenAI adapter uses strict JSON Schema, exact span/evidence-ID validation, advisory-only observations, and a timeout. Missing keys and rejected responses preserve deterministic checks. Live-provider quality is not claimed without evaluation.

03 / VERIFIED BEHAVIOR

The evidence of the build.

82
UNIT / INTEGRATION TESTS

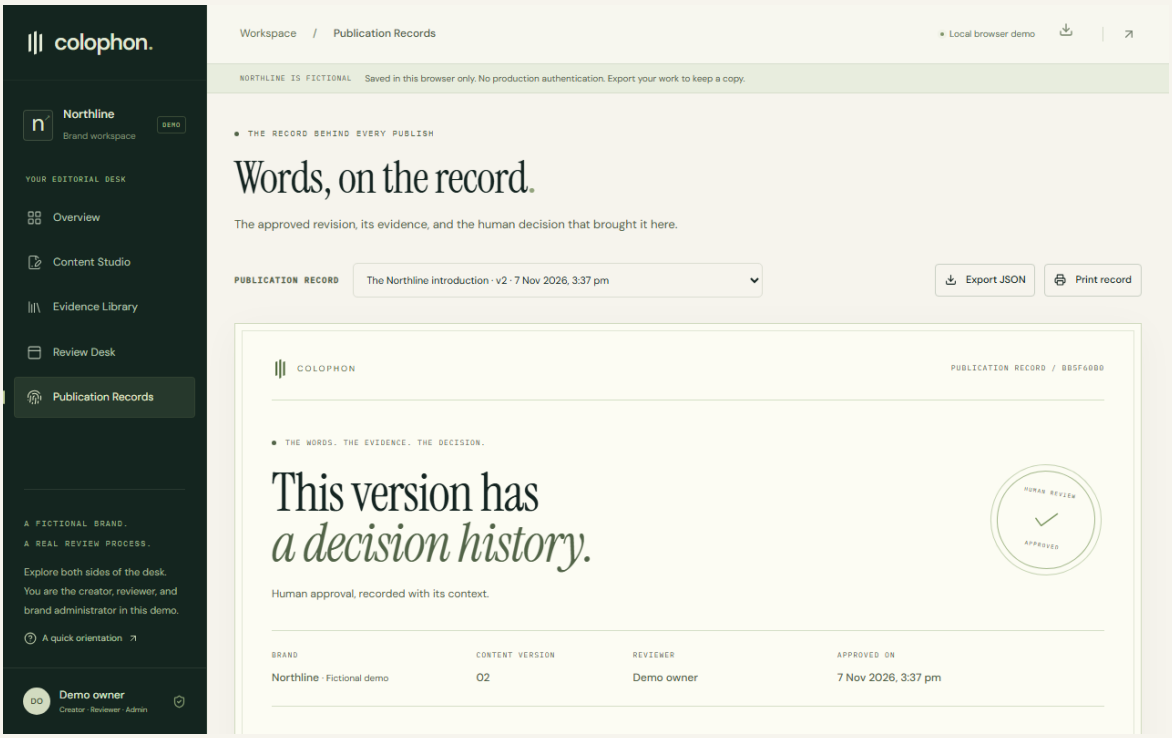

14
BROWSER TESTS

28
LABELLED REGRESSION SAMPLES

Actual results from this implementation: deterministic/domain checks, authenticated-route tests with controlled mocks, the complete judge journey, storage-failure handling, isolation, exact corrections, and responsive approval workflows at 390, 768, 1280, and 1920 pixels.

TypeScript, ESLint, production build, dependency audit, and automated accessibility checks are recorded in docs/VERIFICATION.md. Automated accessibility checks are not a claim of full WCAG conformance. Database integration and live AI evaluation require external configuration.

ACTUAL APPLICATION CAPTURE / PUBLICATION RECORD

A reviewed version, its sources, and the human decision are preserved together. The SHA-256 text fingerprint identifies the words; it is not proof of authenticity or legal certification.

04 / NEXT CHAPTER

Three substantial improvements. *A clear path to Round 3.*

01

Visual Brand Governance

Image uploads, OCR, approved-logo matching, outdated assets, palette/spacing policies, and region-level evidence findings. Acceptance: labelled visual evaluation, source-linked regions, isolated storage, and human-reviewed exceptions.

02

Guideline Debt Analytics

Trace repeated disputes and overrides to their policy revisions. Identify confusing guidelines, show outcome trends, and propose administrator-approved improvements. Never weaken rules automatically.

03

Advanced Evidence Verification

Explicit supersession, better subject decomposition, multi-source conflict handling, source-span validation, and evidence lineage. Acceptance: a held-out regression set with measured unsupported-claim and false-positive results.

Submission readiness

Source: github.com/Kanishk-Rungta/Colophon

Local demo: http://localhost:3000/demo

Public live URL: pending Vercel authentication/configuration and verification.

Deployment instructions, migration, feature status, test results, and limitations are included in the repository.

Tools and assistance disclosure

Kanishk Rungta supplied the product direction and specification. Codex assisted with architecture, implementation, interface design, tests, debugging, and documentation. Significant tools include Next.js, React, TypeScript, Supabase libraries, Vitest, Playwright, axe-core, ReportLab, and PDFium. No additional team members or independent-authorship claims are invented.
